

Minnesota SF 4983

SUPPORTING TESTIMONY

April 4, 2024

Senator Ann H. Rest
Chair, Committee on Taxes
Minnesota Senate

Chair Rest and members of the committee:

NetChoice is a trade association of the world’s leading online businesses. We are leaders in tech policy in the states, in Washington, in the courts, and in international internet governance organizations.

We are represented in today’s hearing by the Hon. Barbara Comstock, who served in the Virginia General Assembly and led legislation to update the sales tax code for data centers. A bipartisan coalition led to nearly unanimous approval and subsequent extensions of the law. Comstock’s original law and subsequent extensions gained the signatures of Republican Gov. Bob McDonnell and Democrat Gov. Terry McAuliffe. All understood that data centers were the infrastructure for innovation and for nurturing high-paying jobs. Virginia thereby opened the door to billions in investment in high-tech data processing and hosting centers, and Virginia remains the number one data center location—*in the world*.

We ask for your support of [SF 4983](#), in order to make Minnesota more competitive for the large-scale capital investments and job creation that comes from large-scale data centers.

Data centers of NetChoice members Amazon, Expedia, Google, and Meta enable individuals and businesses to find information, buy and sell, navigate their world, and maintain their memories in stored communications, documents, photos, and videos. Moreover, data centers help keep us connected, while creating jobs and significant economic impacts in our communities, as explained in [this 2-minute video](#):

Americans depend on the internet to be informed, stay connected, and get their work done.

Data centers create tech jobs, from construction teams and engineers, to technicians and facility managers. These investments boost the local economy, while ensuring a better online experience for Americans everywhere.

Data centers are the essential production equipment to deliver these services, so our members are eager to see Minnesota join other states trying to attract large-scale data centers. However, *no large-scale data center has located in states that impose sales tax on data center equipment.*

The legislation before you today ([SF 4983](#)) would create a new tier sales tax exemption, available only to new, large-scale data centers that invest at least \$250 million.

Why should Minnesota want to attract large-scale data centers?

Not every state has the factors that attract data center investment, especially those that already exist in Minnesota, such as a deep talent pool, availability of affordable land and reliable energy, proximity to airports, and strong community partners. What's missing is the same tax treatment and long-term certainty for equipment that Minnesota already offers for other capital-intensive industries, like manufacturing, agriculture and telecom.

Large-scale data centers contribute significantly to local taxes and are strong supporters of education and broadband expansion. The jobs created in fields like engineering, technicians, electrical and construction trades earn competitive salaries.

Tech industry facilities and data centers are #1 in terms of capital investments in the US.

[PPI's Investment Heroes of 2022 report](#) shows *Information and Data Processing* as the top growth sector for US capital investment, increasing by 720% from 2007. In fact, 4 of the top 6 capital investment companies build data centers (Amazon, Alphabet, Meta, and Microsoft), investing \$94 billion in 2022 – more than energy, telecom, pharma, or manufacturing.¹ This investment trend will continue – in states that make long-term data center investment a possibility.

Pictured here is Meta's data center campus outside of Columbus, Ohio. The initial structure was 970,000 square feet and cost \$750 million.

Construction brought \$244 million to the local supply chain and 1,200 construction workers earned \$78 million in wages.

Across the street, Google is building a \$600 million, 275,000 square foot data center on 440 acres, setting the potential for future expansion.

In states like Missouri, Iowa, Ohio, Illinois, and Nebraska, data centers have been major drivers of investment. A 2022 report from Mangum Economics, *The Impact of Data Centers on the Iowa Economy*,

¹ Progressive Policy Institute, Investment Heroes 2022, at <https://www.progressivepolicy.org/publication/investment-heroes-2022-fighting-inflation-with-capital-investment/>

showed significant results from a growing data center sector, driven by the state's data center incentive programs. Of the more than two dozen data centers, Google, Meta, and Microsoft have large data center campuses in the state.

Data center projects under construction will increase data center investment in Iowa by over 50 percent:

- Apple constructing a \$1.3 billion data center
- Meta Platforms doubling of current footprint, making its Altoona campus the company's largest
- Microsoft doubling its current footprint with two new campuses
- Google has called Iowa home for more than 15 years having invested over \$5 billion in their Council Bluffs facilities and recently expressed interest in expanding into Cedar Rapids.

In Iowa, direct economic impact in 2021 for the construction and operation of data centers was \$934 million, including 2,400 construction jobs, \$167 million in construction pay and benefits, 1,100 full-time operational jobs, and \$96 million in data center operations pay and benefits.

There are also notable indirect economic ripple effects, estimated in 2021 to be \$3.5 billion, including 14,400 jobs and \$970 million in pay and benefits. Plus, for each operational data center job created, an additional 9.8 jobs were supported by the data center in non-construction businesses.

It was further estimated that in 2021, indirect economic activity led to \$107 million in tax revenue collected by the state and \$113 million collected by local governments.

Similarly, the 2022 report from Mangum Economics, *The Impact of Data Centers on the Nebraska Economy*, showed equally impressive economic impacts. NetChoice members Google and Meta Platforms have data center campuses in the state. Major projects under construction in Nebraska include the following, which will double the amount of data center investment in the state:

- Meta Platforms completion of the six-building data center announced in 2018
- The addition of 4 buildings to the campus announced in 2021
- Google has invested \$3.4 billion since 2019 with campuses in Omaha, Papillion, and most recently Lincoln, Nebraska

Direct economic impact in 2021 for the construction and operation of data centers provided \$410 million in economic output, including 1,170 construction jobs, \$65 million in construction pay and benefits, 490 full-time operational jobs, and \$50 million in associated data center operations pay and benefits.

There are also notable indirect economic ripple effects, estimated in 2021 to be \$1.4 billion, including 5,400 jobs and \$393 million in associated pay and benefits. Plus, for each operational data center job created, an additional 6.3 jobs were supported by the data center in non-construction businesses.

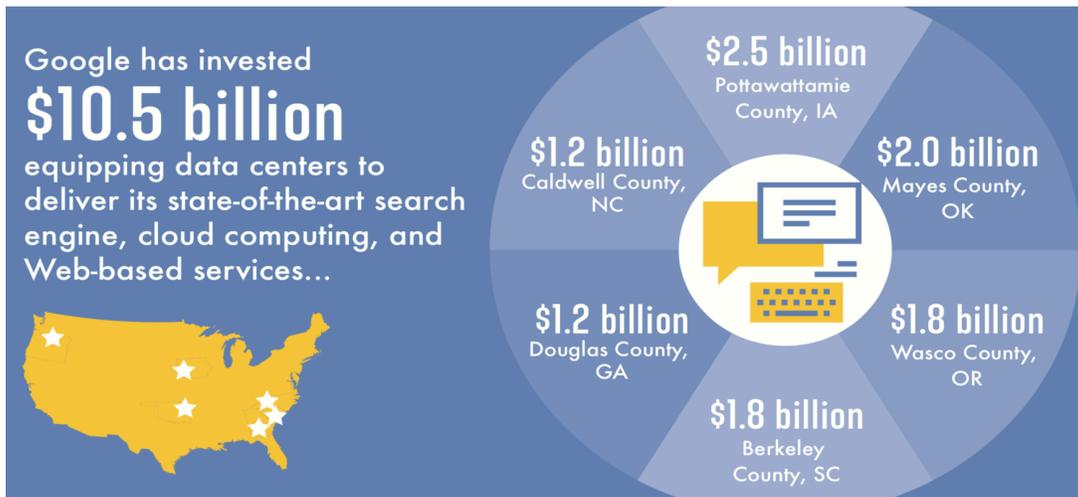

It was further estimated that in 2021, indirect economic activity led to \$30 million in tax revenue collected by the state and \$31.1 million collected by local governments.

These examples from Iowa and Nebraska are a snapshot of states that have added data center economic development programs and experienced strong economic impacts, increased revenue and job creation.

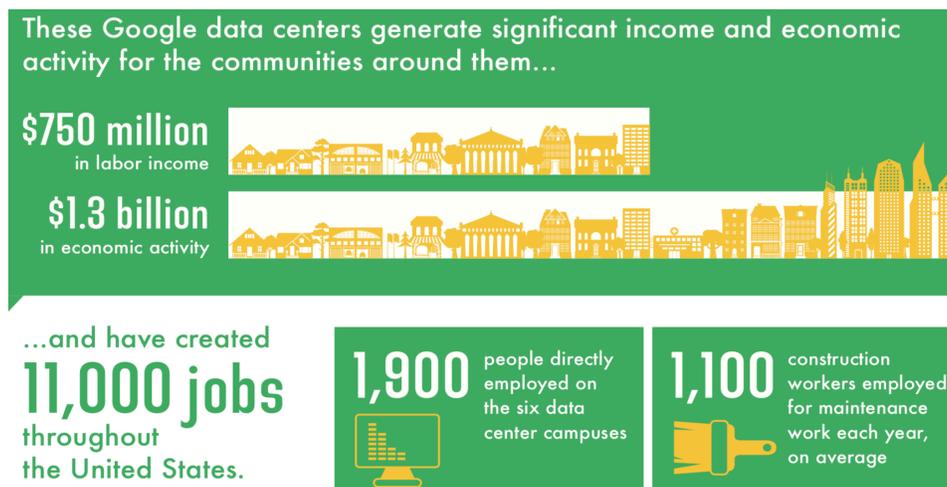

Based on studies of several states with large data center industries, Mangum has recently described the broader benefits, too:

Research has shown that data centers share the pool for high-tech labor with industries such as architecture, engineering, computer system design, software, telecommunications, scientific research & development, and technical consulting. The existence of a vibrant data center market helps to attract talent that supports all of these industries.

Large-scale enterprise data centers are now in several other states that extended their sales tax policies on manufacturing and production equipment. Oxford Economics prepared the following infographic to summarize its study of six Google data centers in rural and suburban counties in Iowa, Oklahoma, Oregon, South Carolina, Georgia, and North Carolina.

Oxford also studied the broader income and economic activity effects of those six Google data centers, finding \$750 million in labor income and \$1.3 billion in economic activity.

Large-scale data centers bring Incremental economic benefits *and* incremental tax revenue

Not only do high wages in the data center industry offer a vital new employment option, but these centers also are a driving force in the development of renewable energy resources and upgrades to utilities and internet infrastructure. Moreover, data centers generate new income and business taxes, sales taxes on non-exempt purchases, and local property taxes.

For that reason, we encourage Minnesota to adopt a “**Here vs Not here**” analysis of whether to extend its sales tax exemptions for manufacturing, farming, and mining production equipment to also apply to data centers. This analysis recognizes the reality that no large-scale data center has located in states that impose sales tax burdens on data center equipment.

Therefore, the decision to extend sales tax production exemptions still generates incremental tax revenue—despite the sales tax exemption on data center equipment. The first table lists several economic benefits that accrue if the state is successful in attracting large-scale data centers:

Incremental economic benefits of data centers	Here	Not here
Income & spending by construction workers & contractors	+	0
Income & spending by data center employees	+	0
Revenue for local suppliers, contractors, lodging, and restaurants	+	0
High-tech training and experience for workforce	+	0
Make the state more attractive for tech business and education	+	0

This second table lists several incremental tax revenue opportunities from data center construction and operation—even after establishing a data center exemption:

Incremental tax revenue from data centers	Here	Not here
Personal income taxes paid by employees and contractors	+	0
Corporate income taxes from data center operators & contractors	+	0
Sales taxes on non-exempt equipment and supplies	+	0
Sales taxes on services related to tangible personal property	+	0
Local real estate & personal property taxes	+	0

In 2019, Virginia’s Joint Legislative Audit and Review Commission (JLARC) evaluated Virginia’s tax incentives for data centers, using confidential tax information from data center taxpayers². JLARC concluded that 90 percent of the investment in data centers would *not* have occurred in Virginia were it not for those tax exemptions. Instead, those investments would have been made in other states that give data center equipment the same tax treatment as equipment used in manufacturing and agriculture.

Over a ten-year period, JLARC’s analysis showed that Virginia’s state government recovered 75 cents in state tax revenue for every dollar of sales tax that was exempted for data center equipment.³

And after considering *local* taxes, Mangum concluded in its 2020 Virginia Study that, “*the ‘cost’ of the State data center incentive is only 10 percent of the amount of State sales tax revenue exempted.*”⁴ At the local level, data centers generated more than \$300 million in local tax revenue for Loudoun County, Virginia in 2019. That money reduces everyone else’s property taxes while supporting local schools and law enforcement, for example. Now these benefits are spreading to counties across Virginia.

Idaho’s legislature adopted a “Here vs Not here” analysis in the Fiscal Note for its 2020 law:

Passage of this legislation will have a positive impact on the general fund.

This legislation is prospective and is intended to attract business investment not already present in Idaho.

*Business investment of two hundred and fifty million dollars (\$250,000,000) or more will create new jobs, not only to directly support the data centers, but also in construction jobs and indirect jobs.*⁵

Example of tax and tech education benefits from data centers in Loudoun County, Virginia

Loudoun County in northern Virginia reported that property tax revenue from data centers was \$735 million in 2023. That was \$ 624 million (85%) from personal property tax and \$110 million (15%) from real estate tax⁶. Data center taxes have allowed Loudoun county to reduce its real estate property tax rate by 41 cents, while still gaining millions of dollars for roads, schools, and public services.

Loudoun’s data center tax revenue has been growing steadily since 2016, when it was only \$146 million. During this time, the data center industry partnered with Northern Virginia Community College to develop a **Data Center Operations** program offering associate’s degree in engineering technology, a

26-credit career studies certificate, and data center operations classes. Many in the program came from low paying fields and now have \$80k-\$100k a year jobs⁷.

Moreover, companies who build and operate data centers in Loudoun County also offer paid on-the-job training. For example, Amazon Web Services has a 12-week data center training opportunity that pays \$20-\$28 per hour to help entry-level trainees become data center technicians⁸.

Large-scale data centers build broadband infrastructure that helps rural communities

Large-scale data centers build new connections to high-capacity fiber networks, and this infrastructure can be leveraged to improve broadband service all along the “middle mile”, including by schools, colleges, and health institutions.

In North Carolina and New Mexico, as in other states, Facebook brought high-speed internet to five counties in a new internet fiber route⁹. Microsoft’s Airband Initiative brings high-speed internet to rural America, partnering with multiple broadband service companies for the effort¹⁰.

States are competing to attract large-scale data centers

While Virginia adopted policies to become the largest data center market in the world, the landscape for attracting data centers has changed. Unlike a decade ago when only five states had tax structures that were welcoming to data centers, today 33 states have sales tax exemptions, as seen in the map below:

⁷ [Pathways to promising data center careers](#),

⁸ [Work Based Learning Program Data Center Operations Technician](#)

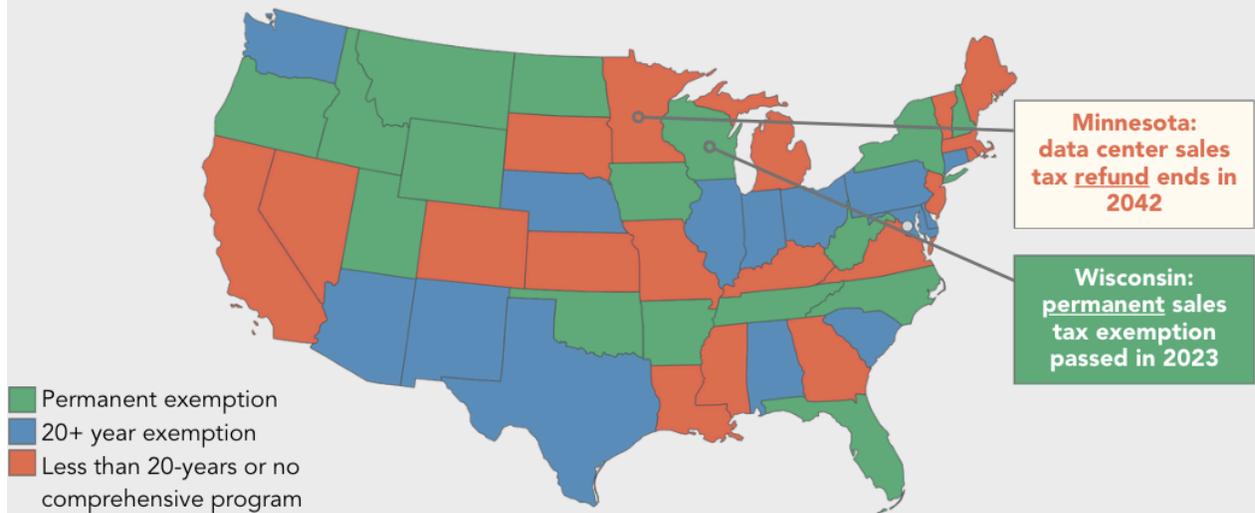

⁹ [Facebook. Nonprofit Bring High-Speed Internet to Rural North Carolina](#) and [Building backbone network infrastructure](#)

¹⁰ [Zayo brings its fiber footprint to Microsoft’s Airband initiative](#)

Put Minnesota on the Map

Large-scale data centers average \$750 million in initial investment, drive millions more in local economic development, and create hundreds of local jobs.

There are no large-scale data centers in states that impose sales taxes on data center equipment. Minnesota should join 30 other states that treat data centers like manufacturing -- by providing a long-term sales tax exemption on initial investments and replacements of servers every 4-5 years.

Over the last few years, neighboring states enacted exemptions and are already realizing new investment and jobs:

Missouri enacted a 15-year data center sales tax exemption with a 10-year extension, and was able to attract a large Meta data center to Kansas City. And Google recently acquired property in Kansas City for a potential data center.

Illinois enacted a data center exemption in 2019, and saw \$4.2 billion in data center investment plus \$4.3 billion in announced investments.

Ohio updated its data center program in 2019, and attracted large-scale data center investment from Amazon, Google, and Meta. In May 2023, Google announced two more data centers, raising their total investment to over \$2 billion.

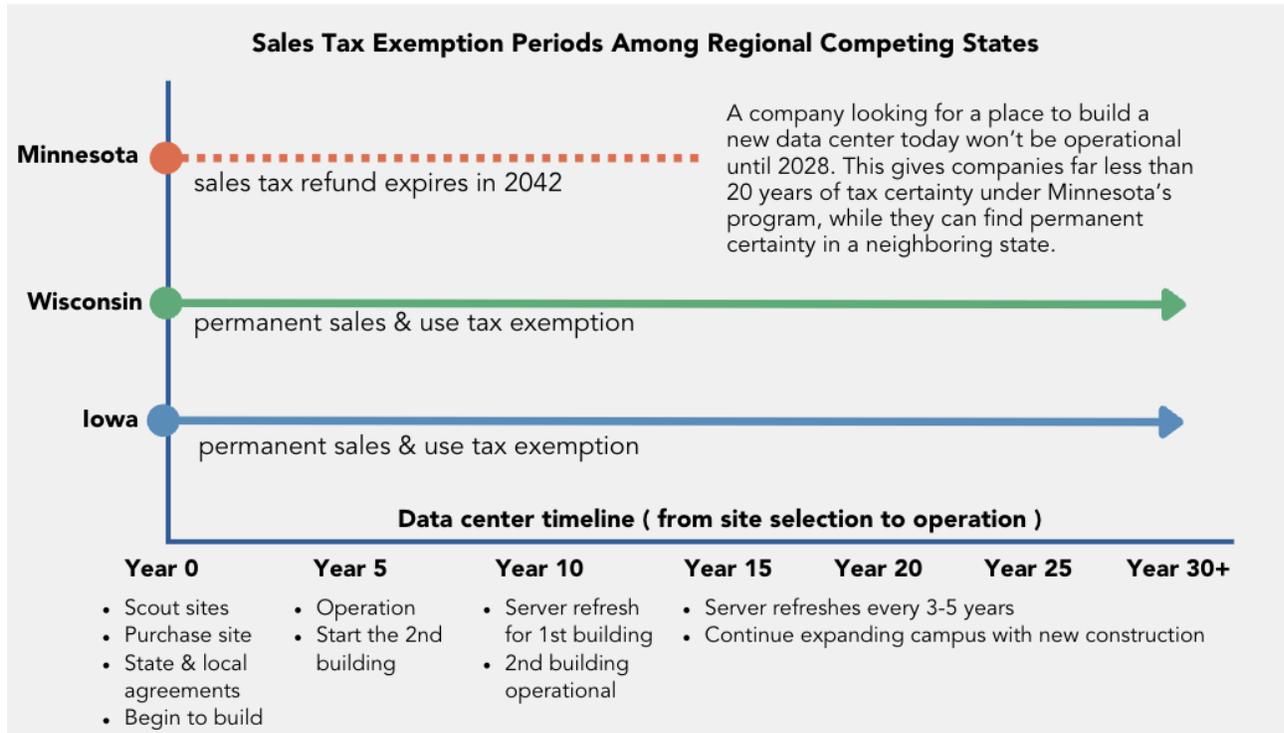

Wisconsin enacted a permanent exemption on equipment and electricity for large data centers in July of 2023.

While Minnesota's current law provides sales tax relief for data centers, that program expires in 2042 – which gives only about a dozen years of exemption for a company starting today to scout for sites in Minnesota. And long-term certainty of sales tax exemptions is critical for large-scale data centers that spend hundreds of millions to refresh server equipment every 3-5 years.

The chart below helps to compare the long-term certainty of Minnesota's current program with that of neighboring states:

Economic Development Competitiveness in Neighboring States

Companies are looking across the Midwest for places to grow their data center footprint. If a company started looking today, Minnesota’s data center economic development program can’t provide them with the same certainty and administrative ease as neighboring states.

The Minnesota Senate should adopt [SF 4983](#) so the state can compete for large-scale data centers that have yet to locate here, and thereby enjoy the jobs and economic impacts that come with them.

Sincerely,

Steve DelBianco
President & CEO, NetChoice

Barbara Comstock
Former Congresswoman and Virginia Legislator, and
Advisor to NetChoice
